

Problem Statement and Objectives Report

1. Introduction

This report defines the core problem addressed by the Adaptive AI-Driven English Learning Application and outlines the objectives derived from the Software Design Document (SDD).

2. Problem Statement

Many English language learners lack access to continuous, personalised feedback outside classroom environments. Traditional teaching methods and existing digital tools often fail to adapt to individual learner needs, resulting in slow progress and reduced confidence.

Educators also face challenges in monitoring learner performance at scale, making early intervention difficult.

3. Project Aim

The primary aim of this project is to develop an AI-driven English learning application that delivers adaptive, personalised learning experiences while supporting educators through analytics and insights.

4. Project Objectives

- To personalise learning content using AI-driven onboarding and behaviour analysis
- To provide real-time translation, explanation, and practice support
- To adapt exercise difficulty dynamically
- To track learner progress accurately
- To provide teachers with actionable analytics

5. Conclusion

By addressing both learner and educator challenges, the project aims to improve English language acquisition through intelligent, adaptive technology.
