

Problem Statement and Objectives

1. Problem Statement

Many English language learners struggle to improve their skills due to limited access to personalised feedback and one-to-one tutoring. Traditional classroom environments often lack the time and resources to provide individual support, while existing digital tools may offer generic exercises without meaningful explanations.

As a result, learners may feel frustrated, lack confidence, and progress slowly.

2. Project Aim

The aim of this project is to design and develop an AI-driven English learning application that provides personalised, adaptive support to learners, helping them improve grammar, writing, vocabulary, and speaking skills.

3. Objectives

The key objectives of the project are:

- To identify learner needs through market and user research
- To design an intuitive and accessible user interface
- To integrate AI features that provide real-time feedback
- To support personalised learning paths based on user performance
- To evaluate the effectiveness of the app through user testing

4. Scope

The project focuses on English language learning at an intermediate to advanced level, particularly for academic and professional contexts.

5. Conclusion

By addressing the lack of personalised feedback in traditional and digital learning environments, the proposed application aims to improve learner confidence, accuracy, and overall language proficiency.
